

Quality Assurance Review Report

Project: Customer Support Ticket Intent Classification

1. Purpose

The purpose of this Quality Assurance (QA) review was to evaluate the consistency, accuracy, and reliability of the annotated dataset after the initial labeling process.

A manual review was conducted to identify incorrect classifications, resolve ambiguous cases, and ensure the annotation guidelines were applied consistently across all samples.

2. Dataset Overview

Item	Value
Dataset Size	100 customer support messages
Annotation Task	Intent Classification
Number of Labels	5
Annotation Method	Manual
QA Method	Manual Review

3. QA Process

The quality assurance review consisted of the following steps:

- Reviewing each annotated customer message.
 - Comparing assigned labels against the annotation guidelines.
 - Identifying inconsistent or ambiguous classifications.
 - Correcting labels where necessary.
 - Recording justification for revised decisions.
 - Verifying consistency across the entire dataset.
-

4. QA Findings

The majority of customer messages were accurately classified during the initial annotation process. Several messages required additional review because they contained multiple possible intents or ambiguous wording. These cases were resolved by identifying the customer's primary intent rather than relying solely on keywords.

5. Examples of Reviewed Cases

Example 1

Customer Message: "Every time I upload a profile picture, I get an "Unexpected Error" message."

Initial Label: Account

Final Label: Technical Issue

Reason: Although the issue affects the account, the reported behavior is caused by application performance and therefore represents a technical problem.

Example 2

Customer Message: "I accidentally created two accounts using different email addresses. Can they be merged?"

Initial Label: General Inquiry

Final Label: Account

Reason: The customer's request concerns managing an existing account rather than requesting general information.

Example 3

Customer Message: "Can I use PayPal instead of a credit card?"

Initial Label: Billing

Final Label: General Inquiry

Reason: The customer is requesting information about supported payment rather than having payment issues.

6. Quality Metrics

Metric	Result
Total Samples Reviewed	100
Labels Reviewed	100%
Ambiguous Cases Identified	18
Label Corrections Made	3
Reviewer Notes Added	3

7. Lessons Learned

The QA process reinforced several important annotation principles:

- Customer intent should take precedence over isolated keywords.
 - Similar messages can require different labels depending on context.
 - Consistent application of annotation guidelines improves dataset quality.
 - Documenting annotation decisions supports transparency and reproducibility.
-

8. Final Assessment

The completed dataset demonstrates a consistent application of the annotation guidelines across all customer support messages.

Following manual quality assurance, the dataset was approved as a reliable example of an intent classification task suitable for AI data annotation and Natural Language Processing (NLP) portfolio purposes.
