

# Project Summary

## Project 003 – Named Entity Recognition (NER)

---

### 1. Overview

This project involved the manual annotation of a Named Entity Recognition (NER) dataset using a span-based annotation approach. The objective was to identify predefined entity types within natural language text while maintaining consistent annotation boundaries and adhering to documented annotation guidelines. The completed dataset consists of 150 manually annotated text samples, covering a wide variety of real-world scenarios, including technology, healthcare, finance, education, government, travel, and business.

---

### 2. Objective

The primary objective of this project was to develop a high-quality NER dataset suitable for Natural Language Processing (NLP) tasks while demonstrating professional annotation practices used in AI data annotation workflows.

---

### 3. Annotation Schema

The dataset includes the following entity categories:

- PERSON
- ORGANIZATION
- LOCATION
- PRODUCT
- EVENT
- DATE
- TIME
- MONEY
- EMAIL
- PHONE

Each entity was manually identified and annotated using a span-based format.

---

### 4. Annotation Workflow

The annotation process consisted of:

- Manual annotation of text samples.
- Application of predefined annotation guidelines.
- Batch-based quality assurance reviews.
- Correction of identified issues.
- Refinement of annotation policies based on adjudication decisions.
- Final validation of the completed dataset.

This iterative workflow improved annotation consistency throughout the project.

---

### 5. Quality Assurance

The dataset underwent six structured quality assurance review cycles.

Each review verified:

- Entity boundaries
- Entity classification
- Annotation consistency
- Formatting accuracy
- Compliance with annotation guidelines

Feedback from each review cycle was incorporated before proceeding to the next annotation batch.

---

## **6. Tools Used**

- Microsoft Excel
- ChatGPT (annotation planning and quality review)

---

## **7. Skills Demonstrated**

- Named Entity Recognition (NER)
- Span-based annotation
- Annotation guideline implementation
- Entity boundary identification
- Quality assurance
- Annotation consistency
- NLP dataset preparation
- Documentation

---

Ultimately, the project resulted in a professionally reviewed Named Entity Recognition dataset supported by comprehensive documentation, including annotation guidelines, quality assurance reports, and project reflections. The completed work demonstrates practical experience with NLP data annotation and reflects a structured annotation workflow similar to those used in AI training data projects.
