

QA Review Report

Project 003 – Named Entity Recognition (NER)

1. Project Overview

This report documents the quality assurance (QA) process conducted during the Named Entity Recognition (NER) annotation project. The objective of the QA review was to evaluate annotation consistency, verify entity boundaries, identify labeling errors, and ensure compliance with the project's annotation guidelines.

2. Quality Assurance Objectives

The QA process focused on verifying:

- Correct entity identification
 - Accurate entity boundaries
 - Appropriate entity type selection
 - Consistent annotation formatting
 - Compliance with annotation guidelines
 - Longest valid entity span selection
 - Consistency across the entire dataset
-

3. Review Methodology

The dataset was divided into six annotation batches.

Each completed batch underwent manual review before the next batch was started.

During each review cycle, the following checks were performed:

- Comparison of annotated entities against the source sentence.
- Verification of entity span boundaries.
- Validation of entity labels.
- Review of annotation consistency.
- Documentation of reviewer feedback.
- Correction of identified issues before proceeding.

This iterative review process ensured annotation consistency throughout the project.

4. Annotation Policy Refinements

Several annotation decisions required clarification during review, including:

- Branded digital services classified as PRODUCT.
- Hotels classified as ORGANIZATION.
- Museums classified as LOCATION.
- Airports classified as LOCATION.
- Named celebrations (e.g., Christmas, New Year) classified as EVENT.
- Seasons excluded from annotation.
- Official entity names beginning with "The" handled on a case-by-case basis.

These adjudication decisions were incorporated into the final Annotation Guidelines.

5. Final Quality Assessment

Dataset Summary

- Total Samples Reviewed: 150
- Review Rounds: 6
- Annotation Method: Manual span annotation
- Quality Assurance: Manual batch review
- Final Dataset Status: Approved

Overall annotation quality remained consistently high throughout the project, with corrections primarily involving minor formatting issues, or annotation policy refinements. All identified issues were reviewed, corrected, and incorporated into the final version of the dataset. The resulting annotations demonstrate consistent application of the project's annotation schema and provide a reliable example of a professionally reviewed Named Entity Recognition dataset suitable for portfolio demonstration.
